

WALLET OWNER		CREATION DATE
DEVICE	Brand / Model / Firmware version (optional)	
PIN		

1		7	
2		8	
3		9	
4		10	
5		11	
6		12	

The diagram illustrates the process of deriving an extended public key. It consists of three main input fields at the top: 'WALLET NAME' (with a pink background and the example 'Alice first wallet (without passphrase)'), 'MASTER KEY FINGERPRINT' (a 32-byte hex string), and 'DERIVATION PATH' (a sequence of integers: m/, '/, '/, ', with a pink background). An arrow points from the derivation path to the 'EXTENDED PUBLIC KEY' field. This field is a 64-byte hex string, with the first four bytes labeled 'X', 'IP', 'IU', 'IB', followed by an ellipsis '...', and then the remaining 56 bytes.

WALLET OWNER		CREATION DATE

1	2	3	4	5	6	7	8	9	10	11	12	
13	14	15	16	17	18	19	20	21	22	23	24	
25	26	27	28	29	30	31	32	33	34	35	36	
37	38	39	40	41	42	43	44	45	46	47	48	
49	50	51	52	53	54	55	56	57	58	59	60	

The diagram illustrates the process of deriving an extended public key. It consists of three main input fields at the top: 'WALLET NAME' (containing 'ex: Alice first wallet (without passphrase)'), 'MASTER KEY FINGERPRINT' (a 32-character hex string), and 'DERIVATION PATH' (a sequence of 'm/' followed by three 'n/' and a final 'n'). An arrow points from the 'DERIVATION PATH' field to the 'EXTENDED PUBLIC KEY' field. The 'EXTENDED PUBLIC KEY' field is a long hex string starting with 'x' followed by several groups of four characters (IP, III, IR, etc.) and ending with '***'.

WALLET NAME

ex: Alice first wallet (without passphrase)

MASTER KEY FINGERPRINT

00

DERIVATION PATH

m/ ' / ' / ' ,

EXTENDED PUBLIC KEY

x IP III IR ... ***
